Defn: Let M, N be C^∞ manifolds, and $F : M \rightarrow N$ a continuous map. Let $p \in M$. Then we say F is smooth at p iff there exist charts (U, ϕ) of M and (V, ψ) of N s.t. $p \in U$, $F(p) \in V$, and

$$\psi \circ F \circ \phi^{-1} : \phi(F^{-1}(V) \cap U) \rightarrow \mathbb{R}^n$$

is C^∞ .

Observe: Since F is continuous, $F^{-1}(V)$ is open, so $F^{-1}(V) \cap U$ is an open neighborhood of p . Thus, $\phi(F^{-1}(V) \cap U)$ is open in \mathbb{R}^m .

Defn: Let M, N be C^∞ manifolds, $F : M \rightarrow N$ continuous. Then F is smooth iff $\forall p \in M$, F is smooth at p .

Lemma: Let M, N be C^∞ manifolds, $F : M \rightarrow N$ continuous. Then F is smooth iff there are atlases $\{(U_\alpha, \phi_\alpha)\}$ of M and $\{(V_\beta, \psi_\beta)\}$ of N s.t. $\forall \alpha, \beta$, $\psi_\beta \circ F \circ \phi_\alpha^{-1} : \phi_\alpha(F^{-1}(V_\beta) \cap U_\alpha) \rightarrow \mathbb{R}^n$ is smooth. This, in turn, is true iff for any pair of atlases $\{(U_\alpha, \phi_\alpha)\}$ and $\{(V_\beta, \psi_\beta)\}$, the previous condition holds.

Proof: (exercise)

The key outcome is that if a function is smooth according to one atlas, it's smooth according to all atlases.

Ex:

$$\begin{array}{ccc} \mathrm{GL}(n, \mathbb{R}) \times \mathrm{GL}(n, \mathbb{R}) \rightarrow \mathrm{GL}(n, \mathbb{R}) & \text{and} & \mathrm{GL}(n, \mathbb{R}) \rightarrow \mathrm{GL}(n, \mathbb{R}) \\ (g_1, g_2) \mapsto g_1 g_2 & & g \mapsto g^{-1} \end{array} \quad \text{are smooth.}$$

$$\begin{array}{ccc} O(n) \times O(n) \rightarrow O(n) & \text{and} & O(n) \rightarrow O(n) \\ (g_1, g_2) \mapsto g_1 g_2 & & g \mapsto g^{-1} \end{array} \quad \text{are smooth.}$$

Defn: A Lie group G is a group which also has a C^∞ structure s.t.

$$\begin{array}{ccc} G \times G \rightarrow G & \text{and} & G \rightarrow G \\ (g_1, g_2) \mapsto g_1 g_2 & & g \mapsto g^{-1} \end{array}$$

are smooth.

Tangent and Cotangent Spaces

We want to construct tangent vectors without requiring an ambient space!

Idea: Vectors in \mathbb{R}^n define “directional” derivatives.

Pick $p \in U \stackrel{\text{open}}{\subseteq} \mathbb{R}^n$, and $v \in \mathbb{R}^n$. Then if $f : U \rightarrow \mathbb{R}$ is C^∞ , we can define $D_v f(p) = \nabla f(p) \cdot v$.

Remark: We can regard D_v as an operator $C^\infty \ni f \mapsto D_v f(p) \in \mathbb{R}$. It has the following properties:

- 1) Linear over \mathbb{R} : $D_v(f + cg)(p) = D_v f(p) + c D_v g(p)$.
- 2) Leibniz' rule: $D_v(fg)(p) = f(p) D_v g(p) + D_v f(p) g(p)$.

This was all motivation. Now, for the formalization.

Defn: Let M be a smooth manifold, $p \in M$. Then the space of germs of functions of M at p is

$$C_p^\infty(M) = \{(f : U \rightarrow \mathbb{R}, U) \mid U \subseteq M \text{ open}, p \in U, f \in C^\infty\} / \sim$$

where $(f, U) \sim (g, V) \Leftrightarrow \exists W \subseteq U \cap V$ s.t. $p \in W$ and $f|_W = g|_W$.

A germ at p is an equivalence class $[f] = [(f, U)]$.

Notation: Given (f, U) as above and $p \in U$, $[f]$ is the class of $(f, U) \in C_p^\infty(M)$.

Lemma: $C_p^\infty(M)$ is an \mathbb{R} -vector space and a ring.

$$\text{a) } [f] + c[g] \stackrel{\text{def}}{=} [f + cg]$$

$$\text{b) } [f] \cdot [g] \stackrel{\text{def}}{=} [fg] \text{ (defined by } fg|_{U \cap V} : U \cap V \rightarrow \mathbb{R})$$

EXER: Show the remaining properties.

Defn: A derivation on M at p is an \mathbb{R} -linear map $D : C_p^\infty \rightarrow \mathbb{R}$ s.t. $\forall [f], [g] \in C_p^\infty(M)$, $D([f]g) = f(p)D[g] + g(p)D[f]$.

Observe: $f(p) = [f](p) \in \mathbb{R}$ is well defined by $[f]$.

Defn: The tangent space to M at p is $T_p M = \{\text{all derivations of } M \text{ at } p\}$.
